

Disaster Recovery & Backup Plan

Document: Disaster Recovery (DR) & Backup Plan **Service Provider:** AL MERAK TAX CONSULTANT L.L.C (E-Numerak) **Date:** 2026-06-23

Confirm/adjust the **[PLACEHOLDER]** schedule and retention values to match your actual backup configuration before submission.

1. Objectives

Metric	Target
RPO (Recovery Point Objective)	[PLACEHOLDER — e.g. 24 hours]
RTO (Recovery Time Objective)	[PLACEHOLDER — e.g. 4 hours]
Backup retention	[PLACEHOLDER — e.g. 30 daily / 12 monthly]

2. What is backed up

Asset	Method
PostgreSQL database (invoices, customers, audit logs)	<code>pg_dump</code> logical backup
Uploaded media (<code>media_files</code> volume: logos, TRN docs, XML/PDF)	Volume / file-level backup
Keystore (PEPPOL AP cert + key)	Secure, encrypted off-host copy (restricted access)
Configuration (<code>.env</code> , <code>nginx.conf</code> , <code>compose</code>)	Versioned in Git + secured secrets store
Application code	GitHub repository (version-controlled)

3. Backup schedule

- **Database:** automated daily dump at **[PLACEHOLDER — e.g. 02:00 UTC]**, stored on **[PLACEHOLDER — separate location / off-site]**.
- **Media volume:** daily/weekly snapshot **[PLACEHOLDER]**.
- Backups are stored **separately from the production host** to survive host loss.
- **[PLACEHOLDER — note off-site / second-region copy if applicable.]**

4. Recovery procedure (summary)

1. Provision a clean host (Docker + compose).

2. Restore configuration + secrets (keystore, `.env`).
3. `git clone` the application; build/run containers.
4. Restore the latest PostgreSQL dump.
5. Restore the media volume.
6. Verify: health checks (`/health/` , `/ready/`), a test invoice create + send, and SMP/AS4 endpoint reachability.
7. Re-point DNS if the host changed.

5. Continuity controls (in place)

- **Monitoring:** Netdata (CPU/RAM/disk/containers) for early warning.
- **Certificate expiry monitoring:** scheduled Celery task alerts before expiry.
- **Health/readiness probes:** `/health/` , `/ready/` .
- **Version control:** all code + config in Git (rapid redeploy).
- **Idempotent deploys:** documented deploy workflow (containerised).

6. Testing

- DR restore is tested **[PLACEHOLDER — e.g. quarterly]** by restoring the latest backup to a staging host and verifying invoice create/send + data integrity.

Confirmation: We maintain the backup and disaster-recovery arrangements described above for the E-Numerak platform. (*Sign + date on submission.*)
